

LANDED COST CALCULATION

Landed Cost is made up of all associated costs of getting goods moved from the seller until the item is delivered to the customer. Items such as taxes, insurance, currency conversion, shipping and handling fees are all essential considerations to enable DDP shipments.

Our modular Landed Cost Calculation API "Mercury" can be partnered with our "Foundation" HS Classification API and P&R Screening tools to determine accurate tariffs & taxes in order to avoid delays, improve customer experience and ensure compliance.

This vital information empowers merchants & marketplaces with a fundamental component of overall cost-to-serve strategy for optimised and streamlined strategic, accounting and profitability planning tools to scale their cross-border activity.

Hidden supply chain costs can increase delivery costs and diminish expected returns. Our "Mercury" Landed Cost Calculation API is a comprehensive solution that supports businesses throughout the eCommerce sales process.

- ◆ Duty and tax calculation
- ◆ Excise taxes and fees
- ◆ Simulation of Costs
- ◆ Currency Conversion - API
- ◆ Sourcing Scenario Comparisons
- ◆ Landed Costs Planning and Management

Effective Landed Cost management can be used not only as a procurement instrument but also as a financial tool.
